

Declared War Against Babylon-America Partial Confirmation Updated... descend rain of rocks and metal, so much that the world will begin to take notice....4-3-26

For the glory of Father God and Jesus Christ

And Then They Will Know That I Am God.... Jesus Christ

From the Heavens which declare the glory of the Almighty Holy One of Heaven's works shall descend rain of rocks and metal, so much that the world will begin to take notice.".....All these things mentioned in this Holy Declaration of War began when He spoke to you on March 11th of your nation's calendar....

11. Rocks falling from the sky and below

The screenshot shows an MSNBC news article. The main headline is "Burns Says The Increase Is Far Beyond Normal Background Noise". The text below the headline states: "Early in the video, Stefan Burns says this is not a case of a small bump in reports caused by more cameras, more doorbells, or more people looking up. He says the increase is closer to 300% in March 2026, perhaps even higher, depending on how the data is counted. Burns points to NASA's fireball database and notes that the agency only lists U.S. fireball events that receive more than 100 reports. Using that standard, he says the previous record in the available dataset, which stretches back to January 2016, was six fireball events in a month. March, he says, is already sitting at eleven." A video player is embedded in the article, showing a man (Stefan Burns) speaking. The video player has a caption: "Fireball Sighting Brandenburg, Germany March 21st 2026 7:27 PM (19:27) CET CC: Christian Heller". Below the video player, there is a caption: "Image Credit: Stefan Burns. That is not a subtle change. That is nearly double the old record and roughly six times higher than the average month in that database, which Burns says is two. He also notes that this is only the U.S. side of the picture. Burns walks through reports and videos from Germany, Tennessee, Washington state, Trinidad and Tobago, the". To the right of the article is a social media share button for YouTube Shorts, with a description: "The U.S. is under attack by fireballs. #fireball #shorts". Below the share button is a table with the following data: "N/A Likes", "58 Views", "Mar 30 2026". Below the table is a description: "On March 21, 2026, a massive fireball over Houston dropped a centaluge-sized meteorite through the roof of Sherie James. NASA confirmed the 1-ton rock hit the atmosphere at 85,000 mph. It's part of a massive surge in fireball activity this month. Subscribe to carnotz to see the system fail. [+]" Below the description are several hashtags: "#Houston #meteors #usa #real #english #shorts #carnotz #breakingnews2026 #astonomy #space #physics".

0:00 The sky over America has been on fire.

0:03 Not metaphorically, literally. Since March 10th, 2026, the United States has

0:10 been struck by more large fireballs than any single month in 15 years of recorded history. And it is not even close. The

0:18 rate is 4.5 standard deviations above normal. A number statisticians reserve for events that simply should not happen.

0:28 79% of them shook the ground when they landed. Three separate rocks recovered from three separate impacts across two

0:36 continents all carry the same rare mineral fingerprint, the same one. Now, here is what the news will not tell you.

Fireballs Are Falling at an Alarming Rate...No One Knows Why

 Meteors and fireballs have been streaking across multiple U.S. states... Pennsylvania, Texas, California, and Ohio... all within days. One even crashed through a woman's roof. NASA confirmed the events, but many are asking: why so many at once?

 Something is happening in our skies—and it's not just another meteor shower. Some suggest it may be UAPs or spy satellites. Over the past few weeks, fireballs, aerial objects, and unexplained lights have been seen across multiple countries and major cities. While some officials and scientists point to meteors and atmospheric debris, others are raising serious questions about movement patterns, speed, and behavior that don't match known physics.

DATA ANALYSIS | 01 2026 FIREBALL ACTIVITY

Has Something Changed in the Near-Earth Meteoroid Environment?

The first quarter of 2026 has produced what appears to be a significant surge in large fireball events. The data, drawn from the AMS database going back to 2011, shows a pattern that warrants serious investigation. Here is what the numbers say, what they don't say, and what we need to find out.

Originally Published: March 25, 2026 · By Mike Huxley assisted with Claude AI for the American Meteor Society

- Updated March 31, 2026**
- All data streaming through end of quarter (March 31) - 2026 now at 2,322 total events, 48 at 5th magnitude, 36 at 5th+
 - Added Poisson statistical analysis with significance testing for event thresholds and radiant area concentrations.
 - Updated radiant heatmap chart with a new trajectory-resolved events and Aerial ion-high-resolution zone overlays
 - Added interactive geographic event map (70 events worldwide via Plotly)
 - Updated all charts, data tables, and supporting CSV/JSON downloads to reflect full Q1 data
 - Corrected errors where the classification from meteor to unexplained dramatic (such as 1/21/26)

There is a Serious Risk of a Large Impact Event Occurring. This is Not a Drill...

Fireballs and bright meteors have been reported across multiple regions worldwide, including Canada, California, Ohio, Texas, Turkey, the Netherlands, and Germany. Eyewitnesses describe loud sonic booms, intense flashes, and objects streaking across the night sky. Recent confirmed events include a major fireball over Texas with sonic booms and fragments detected, as well as sightings across California, Oregon, and Nevada, and multiple reports across Europe including Germany and the Netherlands.

Is this an unusual surge in meteor activity, or are we simply seeing more due to increased cameras and reporting? What could be behind this wave of sightings?

Something strange is happening in our upper atmosphere, and even the experts are struggling to explain it. Since the start of March 2026, a massive flurry of fireballs has been blizzing through Earth's sky. From Vancouver to Houston, these aren't just typical meteors—they are producing ground-shaking sonic booms and causing real-world damage.

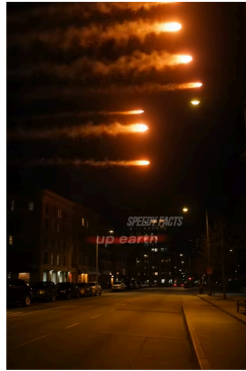

Last Saturday, March 21, one of these cosmic visitors actually punched through the roof of a home in Texas. New analysis shows many of these rocks are originating from a single, high-intensity patch of the sky known as the Arctellion source. While NASA says there is no immediate extinction-level threat, the intensity of this debris has nearly doubled this year.

Are we just getting better at seeing them... or is something in deep space pushing these rocks toward us? Share your theory below!

Have you noticed an increase in meteor sightings this year? Astronomers are puzzled by the recent surge in fireballs and sonic booms across the globe. In this video, we delve into the data provided by the American Meteor Society (AMS) to uncover the reasons behind this unusual phenomenon. The year 2026 has witnessed an unprecedented number of meteors, with over 2,000 people witnessing a daytime fireball over Western Europe and hundreds more reporting sonic
